

Is Florida Getting Warmer?

George Papaeracleous

26 October 2025

Results & Interpretations

Observed Pearson correlation coefficient was calculated between year and temperature to be $r = 0.53$ (Fig. 1). A permutation test, of 10,000 permutations, was done, and it gave a p-value of $p < 0.01$, indicating a significant positive relationship between time and temperature (Fig.1 & Fig.2).

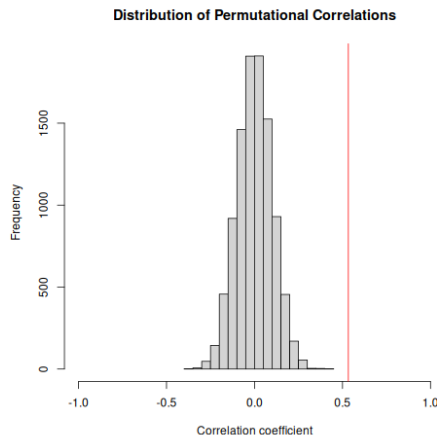

Figure 1: Distribution of correlation coefficients from 10,000 permutations. Red line shows the observed correlation.

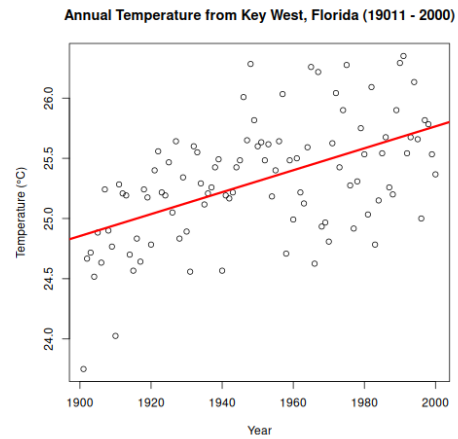

Figure 2: Annual mean temperature in Key West, Florida (1901–2000). Red line shows the linear trend.
